

Hospital Alpha - Clinical Summary

Confidential demo document for NO SUS judging.

Organization: Hospital Alpha

Document type: Clinical outcomes summary

Research area: Sepsis-risk intervention timing

Key findings:

- Early immune-response monitoring within the first 6 hours correlates with lower escalation risk.
- Patients receiving intervention during the 4-8 hour window showed improved stabilization.
- The strongest clinical signal is intervention timing, not dosage variation.
- No patient identifiers are included in this synthetic demo document.

Private research signal used for demo:

- immune response timing: high
- cohort outcome agreement: medium
- biomarker novelty: low

Restricted notes:

- Raw patient records must not be shared with partner organizations.
- The AI layer may only see aggregate findings and authorized summaries.
