

Research Lab Gamma - Biomarker Report

Confidential demo document for NO SUS judging.

Organization: Research Lab Gamma

Document type: Biomarker research report

Research area: Sepsis-risk intervention timing

Key findings:

- A candidate biomarker appears linked to immune-response changes.
- The biomarker peak appears later than the 4-8 hour clinical window.
- This creates a useful contradiction: the clinical signal is early, while one lab marker trends later.
- The lab can support a joint validation study without exposing assay recipes.

Private research signal used for demo:

- immune response timing: low
- cohort outcome agreement: low
- biomarker novelty: high

Restricted notes:

- Lab notebooks and assay details remain confidential.
- The AI layer may summarize the contradiction but must not receive raw lab notes.
