

University Beta - Cohort Study

Confidential demo document for NO SUS judging.

Organization: University Beta

Document type: Statistical cohort analysis

Research area: Sepsis-risk intervention timing

Key findings:

- Independent cohort statistics support a 4-8 hour intervention window.
- Immune-response markers improve model confidence when combined with clinical timing.
- The data agrees strongly with Hospital Alpha on intervention timing.
- Raw statistical tables and unpublished methods are withheld in this demo workflow.

Private research signal used for demo:

- immune response timing: medium
- cohort outcome agreement: high
- biomarker novelty: low

Restricted notes:

- The full cohort table must not be sent to another organization or to AI.
- Only safe aggregate findings should be used for collaboration intelligence.
